

Introduction

Welcome to CreditChek's API documentation. These are the live APIs that can be used when integrating with CreditChek Infrastructure.

About CreditChek

We are building a credit-worthy Africa! - Sign Up and give Underserved Africans a financially free life with convenience and confidence.

We are helping lenders and post-paid services organisations reduce bad debts.
Before you do Anything

Please sign Up to get started here - <https://app.creditchek.africa/auth/signup>

CreditChek APIs are all RESTFul based and can be accessed or tested directly here with your API Check for "App Page" to see the default CreditChek App, and obtain your secured API credentials from the App page details. use the RESTFul API test tool or PostMan API tool to obtain validated API keys accordingly.

Live URL

<https://api.creditchek.africa/v1>

Both Live & Test Keys when performing API Testing or customer App integration with this platform only accept encrypted values passed as header tokens.

Our Authentication Endpoint performs real-time encryption, decryption, authentication, and validation on each API request from customers. We've grouped the CreditChek API Docs to help you easily find exactly what you need and guide you through the process of integration.

Authentication

You can login with your credentials into the Web Portal. Use the default "CreditChek" app API keys or create your preferred App with your details.

All CreditChek API Endpoint accepts your unique secured API public Key as a Header token. Only the RADAR Endpoint uses the same API Public Key as the "Bearer token". You can manage your API keys from the dashboard.

Sample Header

token: oCLkJivg2ol5P9iG39454OUYMvOgXT1XbAPmjF/1qyjDr8SwTssHcDpb4Cl0iVSa

Generally, we provide both public and secret keys. For Security reasons we went further ahead to encrypt your keys with the AES 256 bit encryption algorithm.

If for any reason you believe your keys has been compromised or you wish to reset them, you can do so from the dashboard.

Secure your keys

Do not commit your keys to git, or use them in client-side code.

API requests made without authentication will fail with the status code 401 :

Unauthorized. All API requests must be made over HTTPS.

Secure your requests

Do not set VERIFY_PEER to FALSE. Ensure your server verifies the SSL connection to CreditChek

Ensure to check this boxes ☒ during your complete integration of our services.

Happy building and integration...

Love from CreditChek Team..

Sample Requests

We provide sample API calls next to each method using cURL. All you need to do is insert your specific parameters, and you can test the calls from the command line. See this tutorial on [using cURL with APIs](#).

Requests and Response

Both request body data and response data are formatted as JSON. Content type for responses will always be `application/json`. Generally, all responses will be in the following format:

Response format

```
{
  "success": [boolean], // Only true if the details provided could be processed and no error
                        // occurred while processing
  "message": [string], // Explains why status is false... Entirely informational. Please only log
                        // this but do not use for your checks
  "data": [object] // contains actionable result of processing if present
}
```

While, it could be useful to use HTTP status codes to determine the result of an API call, we have provided a handy success key to let you know upfront if the request was successful or not.

The message key is a string which will contain a summary of the response and its status. For instance when trying to retrieve a list of customers, message might read "Customers retrieved". In the event of an error, the message key will contain a description of the error as with the authorization header situation above. This is the only key that is universal across requests.

The data key is where you want to look for the result of your request. It can either be an object, or an array depending on the request made. For instance, a request to retrieve a single customer will return a customer object in the data key, while the key would be an array of customers if a list is requested instead.

Wallets

You can get your wallet balance using the endpoint below. You're advised as well to set a wallet threshold limit so you can get notified via email whenever your balance goes below the set limit to avoid service disruption.

Response format

```
curl --location --request GET 'https://api.creditchek.africa/v1/wallet/' \
--header 'Authorization: Bearer
nAuVJ2T2TokenNoOcQBPsf1TokenwIJyTSIFDTOKENMchQXb44Token5GyKG'
```

Errors

As stated earlier, CreditChek's API is RESTful and as such, uses conventional HTTP response codes to indicate the success or failure of requests.

For more enquiries, please reach out us @ E-mail: support@creditchek.africa

Webhooks

CreditChek uses Webhooks to communicate updates on requests initiated with our API for you to kick off additional workflows based on these events. Due to credit bureau downtime or services that takes time for a response, CreditChek submits a POST request to the designated Webhook URL with updates about the transaction.

Your endpoint should respond to webhooks as quickly as possible. To acknowledge receipt of a webhook, your endpoint must return a 2xx HTTP status code. This status code should only indicate receipt of the message, not an acknowledgement that it was successfully processed by your system. Any other information returned in the response headers or response body is ignored.

Security

All Webhook requests are sent with a `x-auth-signature` header for verification. It should match the secret key pair of the app public key you used when initiating the request.

Nodejs Example

// example js implementation

```
const secret = process.env.CREDITCHEK_SECRET_KEY;
```

```
function verifyWebhook(req, res, next) {  
  if (req.headers["x-auth-signature"] !== secret) {  
    return res.status(401).json({  
      message: "Unauthorized request.",  
    });  
  }  
  next();  
}
```

```
router.post("/webhook", verifyWebhook, (req, res) => {  
  const webhook = req.body;  
  switch (webhook.event) {  
    case "pdf_upload":  
      // do something with webhook.data;  
    }  
  }  
})
```

```

    case "borrower_onboarded":
      // do something with webhook.data;
    case "income_insight":
      // do something with webhook.data;
    case "income_transaction":
      // do something with webhook.data;
    case "credit_premium":
      // do something with webhook.data;
    case "credit_advanced":
      // do something with webhook.data;
      break;
  }
  return res.sendStatus(200);
});

```

Retries & Failure

In a case where CreditChek was unable to reach the URL, all the webhooks will only be tried once. It's advisable that Webhook URLs respond with a status 200 OK, before carrying one with processing the data in it. To retry a failed webhook you can go to your dashboard audit logs to re-send a webhook.

Sample webhook format

The JSON payload below is a sample response of a webhook event that gets sent to your webhook URL. You should know that all webhook events across CreditChek all follow the same payload format as shown below.

Sample Credit Webhook payload

```

{
  "event": "credit_premium",
  "data": {
    "score": [Object],
    "bvn": 44550011223,
    "name": "Ndaka Kadir Hassan",
    "_id": "5fbcde8f8699984153e655a0",
    "gender": "Male",
    "dateOfBirth": "20/09/1994",
    "address": "No 1, Chevron Drive, Lagos",
    "phone": 0802,
    "email": "hi@creditchek.africa",
    "bureauStatus": [Object],
  }
}

```

```

}
Sample Income Webhook payload
{
  "event": "pdf_upload",
  "data": {
    "success": true,
    "pageCount": 14,
    "accountName": "Test Jorm",
    "accountNumber": "7160010613",
    "accountType": "savings",
    "bankName": "fidelity bank",
    "bankCode": "070",
    "pdfUrl":
    "https://res.credithek-africa/image/pdfStatement/62877574ae22b03091_070_savings_fidelity%
    20bank.pdf",
    "bvn": "22357999900",
    "borrowerId": "64c8b66302ed6ac59be6fa44"
  }
}

```

Server-side Implementation

To keep your business informed about transaction results outcomes (objects) through our API & SDK, we strongly recommend the use of Webhooks. This feature enables you to initiate additional workflows based on transaction events. Whenever an event you're subscribed to occurs, Credithek will dispatch a POST request to the Webhook URL you specified, including information about the transaction event.

To activate webhook requests, you must enable this feature on the dashboard settings and configure your correct webhook Callback URL, which should accept POST HTTP requests.

Webhook requests include an "x-auth-signature" on the header, containing your app's LiveSecretKey, for verification purposes. You can leverage this key to authenticate and authorize your unique webhook request.

Sample Webhook Response

```

{
  "success": true,
  "message": "Loan history fetched",
  "data": [
    {

```

```

```

Get base URL

Example Request

```
curl --location --request GET 'https://api.credithek.africa/v1/identity/'
```

Response

```
{  
  "message": "Welcome to Identity API Service!"  
}
```

Submit borrower data (consent & onboarding link)

Due to privacy and data protection (NDPR & GDPR), this endpoint implies consent (user permission data) given by the borrower and helps onboard the borrower with these details on your Credithek business dashboard to perform other assessments.

POST: <https://api.credithek.africa/v1/identity/widget/submit>

Request Parameters

Name	Position	Required	Description
appId	body	True	your app ID
bvn	body	True	user bvn
fullName	body	True	user full name
email	body	True	user email
phoneNumber	body	True	user mobile no
gender	body	True	user gender
residentialAddress	body	True	user address

residenceType	body	True	e.g owned, rented, temporary
maritalStatus	body	True	single, married, divorced
dateOfBirth	body	False	date of birth

Optional paramters include: occupation, guarantorName, guarantorEmail, guarantorAddress, guarantorPhoneNumber, employerName, employerAddress, loanAmount and loanTenure

Example Request

```
curl --location --request POST 'https://api.creditchek.africa/v1/identity/widget/submit' \
--data-raw '{
  "fullName": "Lionel Orishane",
  "email": "lionel.orishane@orib.co",
  "phoneNumber": "09070822819",
  "bvn": "22447917803",
  "residentialAddress": "PH, Rivers State, Nigeria",
  "residenceType": "owned",
  "appld": "622dff1cfea683001b7cc977",
  "maritalStatus": "single",
  "dateOfBirth": "18/02/2001",
  "gender": "male"
}'
```

Response

```
{
  status: true,
  data: [Object],
  message: "successful",
  error: false
}
```

Get borrower

GET: https://api.creditchek.africa/v1/identity/check?bvn=*bvn*

Request Parameters

Name	Position	Required	Description
token	Headers	True	app public key
bvn	query	True	user bvn

Example Request

```
curl --location --request GET 'https://api.credithek.africa/v1/identity/check?bvn=22372292144' \

KYC Consent(BVN-iGree)

POST: <https://api.creditchek.africa/v1/identity/bvn-verification/igree>

Sample request bvn: 12345678901 and 12345678902

This endpoint is designed to facilitate BVN validation, allowing customers to verify their Bank Verification Number (BVN) by providing specific information. In order to validate their BVN, merchants are required to enter the BVN number, indicate the type of call they wish to make, select a verification method that suits their preference, choosing between the available options of "email", "phone", or "all". Then they input a channel which includes a string of the contact to receive the One-Time Password (OTP), and enter the OTP sent to the chosen channel.

This new system is to enable the collection of consent directly from the BVN holder, ensuring that their personal information is protected and their banking transactions are secure. Overall, the endpoint serves as a valuable tool for ensuring the accuracy and security of banking information.

Request Parameters

Name	Position	Required	Description
------	----------	----------	-------------

token	Header s	True	app public key
bvn	body	True	user Bank Verification Number
verification_method	body	False	preferred medium for users to receive otp, options are "email" or "phone" and default is "all"
mode	body	True	This is used to indicate the particular type of call you want to make and can be set to either of these; INITIATE, SET_CHANNEL, FINALIZE
channel	body	False	String of the contact to receive OTP
otp	body	False	The One-Time-Password received via email or phone number as chosen

Example Request

```

---
curl --location 'https://dev.creditchek.africa/v1/identity/bvn-verification/igree' \
--header 'token: {{token}}' \
--header 'Content-Type: application/json' \
--data '{
  "bvn": "22339999601",
  "mode": "INITIATE",
  "channel": "0815****8883",
  "otp": "1234"
}'
---
```

Sample Responses

INITIATE Response

```

{
  "status": true,
  "data": {
    "detail": "These are the contact details tied to your BVN. Choose where you want the OTP delivered.",
    "contacts": ["0815****8883"]
  },
  "message": "successful",
  "error": false
}
```

SET_CHANNEL Response

```

{
  "status": true,
```

```
"data": {},
"message": "Please provide the OTP sent to 0815***8883",
"error": false
}
```

Finalize Response

```
{
